#### **Sandhill View**

# **Science Curriculum Policy**

#### Aspire, Achieve, Enjoy

# **Academy Aim**

Here at Sandhill View Academy, we aim to securely equip <u>all</u> of our students for life beyond school as successful, confident, responsible and respectful citizens. We believe that education provides the key to **social mobility** and our curriculum is designed to build strong foundations in the knowledge, understanding and skills which lead to **academic and personal success**. We want our students to **enjoy** the challenges that learning offers. Ultimately, we want students to '*Know More, Do More and Go Further*'

Our aims are underpinned by a culture of **high aspirations**. Through developing positive relationships, we work towards every individual having a strong belief in their own abilities so that they work hard, build resilience and **achieve** their very best.

#### **Intent**

We aim to provide a high-quality science education that provides the foundations for understanding the world through the disciplines of biology, chemistry and physics. Science is vital to the world's future prosperity, and our curriculum allows students to develop and apply their substantive knowledge, disciplinary knowledge and discover and participate within STEM careers. Through building up a body of core knowledge and concepts, pupils are encouraged to recognise the power of rational explanation and develop a sense of excitement and curiosity about natural phenomena. They will be encouraged to understand how science can be used to explain what is occurring, predict how things will behave, and analyse causes.

The curriculum aims to ensure that knowledge is taught to be remembered, not encountered. The curriculum embraces learning from cognitive science about memory, forgetting and the power of retrieval practice. Knowledge for each scheme is planned to be interleaved with prior and future learning to support students' understanding of the most complex concepts.

The curriculum aims for pupils to:

- Develop scientific substantive knowledge;
- Develop understanding of the nature, processes and methods of science through different types of scientific enquiry that help them answer scientific questions about the world around them;
- Develop and apply disciplinary knowledge such as: observational, practical, modelling, enquiry, problem solving and mathematical skills, both in the laboratory, in the field and other environments;
- Develop their ability to evaluate claims based on science through critical analysis of the methodology, evidence and conclusions, both qualitatively and quantitatively.

Each topic within the programme of study has a career attached which is covered, in detail, on a local, national, and global level. In addition to subject specific links, we aim to explicitly reinforce the skills and aptitudes which employers say are important in the workplace;

- Resilience (Aiming High, Staying Positive);
- Collaboration (Teamwork, Leadership, Listening, Speaking);
- Creativity (Problem Solving).

The British values of democracy, the rule of law, individual liberty, and mutual respect of those with different faiths and beliefs are taught explicitly and reinforced in the way in which the school operates.

# Sequence and structure

#### **COVID Recovery 'Unlocking Learning'**

As the impact of COVID is now impacting on students who missed learning during KS2 all students complete a baseline assessment upon entering the Science curriculum in September. This allows for an understanding of the gaps in pupil knowledge and how to further support their progress in future planning. Many students missed the opportunity to complete practical activities that further develop their disciplinary knowledge and therefore an emphasis on students accessing practical experimental work is made. Students complete skills-based units throughout Year 7 and Year 8 to support student transition to Secondary education.

# **Literacy**

We know that students who read well achieve well. As such all subject areas are committed to providing regular opportunities to read extensively. In Science we provide opportunities for students to read Tier 2 and Tier 3 vocabulary with an emphasis on comprehension and application. We also support our students to use ambitious vocabulary including using Frayer models and 'push' techniques to widen the vocabulary students can confidently include in the work they produce. Coherent and fluent writing skills are also imperative for student achievement, so we support student writing skills by offering opportunities for extended writing, with modelling, and sentence stems to support.

#### The Key Stage 3 Science Curriculum:

# KNOW MORE: Our Key Stage 3 Science Curriculum includes the following areas of study:

Three year KS3 where students complete the KS3 National Curriculum as well as bridging topics known as 'Fundamentals' to support students accessing KS4. There are 8 hours per fortnight for Year 7, Year 8, and Year 9.

microscopic
samples.

Cross-curricular knowledge: Links to adaptations of cells including single celled organisms to Geography

Topic title and key concept:

Movement – the study of how the human body facilitates movement including joints, muscles, and bones.

Substantive
Knowledge:
How do
muscles,
bones, and
joints create
movement in
the human
body?

Disciplinary
knowledge:
Practical
activities include
a muscle

How can mixtures be separated based on their component substances?

<u>Disciplinary</u> knowledge:

There are

several

practical

activities in this topic including filtering insoluble solids and solvents, crystallisation of soluble solids and solvents, distillation of mixtures of liquids, and chromatograph y used to separate colours. Students also focus on scientific method including planning practical methods and graph skills.

Crosscurricular knowledge:

Links to graph skills covered in the maths curriculum

knowledge: Links to the maths curriculum through the speed = distance/time equation as well as calculating acceleration using the rearrangeme nt of formula and substitution.

Topic title and key concept:

Interdepende nce – students study the relationships between predators and prey and how they connect through food chains and food webs. There is also a focus of how humans affect these including using chemicals such as pesticides and

Substantive Knowledge: How are animals and plants connected?

fertilisers.

How is the periodic table organised?

Disciplinary knowledge:

Students complete a practical investigation of the properties of group 1

Students
complete an
investigation
into
displacement

reactions.

metals.

Crosscurricular knowledge:

Links to engineering and the properties of materials

Topic title and key concept:

Energy costs and transfers – how electricity is generated and the cost of this to people

Substantive Knowledge: What does it cost to investigate
environmental
and inherited
characteristics
and how this
variation is
representative
of the human
population

Cross-curricular knowledge:
Links to the mathematics curriculum through the study of data; continuous and discontinuous and how it can be displayed

such as ceramics.

Substantive Knowledge: How are rocks formed?

Disciplinary knowledge:
Practical investigations in this unit include reactions of metals and rocks to observe their composition.

Cross-curricular knowledge: Links to geography and outdoor learning but studying how rocks are formed and how this rock cycle leads to changes in rock formation.

Topic title and key concept:

Universe – this topic consists of objects in the night sky and the night sky as well as how they influence our understandin g of

<u>strength</u>
<u>practical</u>
focussing on
<u>antagonistic</u>
muscles.
Cross-curricu
knowledge:
Links to PE a
muscle stren
including how

Cross-curricular knowledge:
Links to PE and muscle strength including how muscles can be built through exercise.

Topic title and key concept:

Gravity – the study of gravity, mass, and weight and the physical laws that connect them.

# Substantive Knowledge:

How are mass, weight, and gravity connected?

Disciplinary knowledge:

**Practical** activities <u>include</u> measuring forces using newton meters for different masses to determine the value of gravitational field strength on Earth. Students are also able to draw conclusions from demonstration s of objects falling in a vacuum.

Crosscurricular knowledge: Links to using and Disciplinary
knowledge:
Students
develop their
understandin
g of scientific
diagrams and
how they can

be explained

Crosscurricular knowledge: Links to the geography and outdoor learning curriculum through the use of fertilisers and pesticides and how they lead to bioaccumulat ion

Topic title and key concept:

Plant
reproduction
- the main
reproductive
organs in
plants and
how they
lead to
pollination
and
germination.

Substantive Knowledge: How do plants reproduce?

# generate electricity?

Disciplinary
knowledge:
The
development
of
mathematical
skills by
calculating
energy in
various
scenarios

Crosscurricular knowledge: Links to engineering and how electricity is generated in power stations phenomena on earth such as the seasons and the phases of the moon

Substantive Knowledge: What is the composition of space?

Disciplinary

knowledge: A
practical
investigation
into the
impact of
meteors on
the surface of
the Earth and
how scientists
can
determine
information
about these
meteors from
their craters.

Crosscurricular knowledge: Links to the mathematics curriculum including calculations of orbits

		rearranging equations with the maths curriculum as well as a focus on graph skills.	Disciplinary knowledge: Students complete a practical activity related to the shape of seeds and their dispersal methods including graphical skills, writing methods, apparatus, and writing conclusions and

Students focus on the pitch and loudness of sounds and how oscilloscope traces represent sound waves as well as uses of sound waves by humans and animals.

# Substantive Knowledge:

How can the pitch and loudness of sound waves be changed?

Disciplinary
knowledge:
Teacher led
demonstrations
of sound in a
vacuum.

Cross-curricular knowledge: Links to pitch and loudness of sound waves to Music

Topic title and key concept:

Electricity – this topic includes circuit symbols and their uses as well as the concepts of potential difference, current and how static electricity is caused.

Substantive Knowledge: How are

# process of breathing?

Disciplinary
knowledge:
Students
completed
skills work on
measuring
their lung
volume and
comparing this
to other body
qualities such
as height.

Crosscurricular knowledge: Links to PE and the effect of exercise on the body.

Topic title and key concept:

Respiration: the study of the process of respiration including the different types and how it is used to make products such as alcoholic drinks and bread.

Substantive Knowledge: What are the different types of respiration and how are they used? changes as well as thermal decompositio n and combustion as examples of chemical reactions

Substantive Knowledge: What are different types of chemical reactions?

**Disciplinary** 

knowledge: **Students** complete practical activities including combustion, and thermal decompositio n. There is a development of student understandin g of conservation of mass through investigations into mass

Crosscurricular knowledge: Links to geography relating changes of state to physical changes

changes.

gases including some factors that affect this.

Substantive Knowledge: What are factors that affect pressure in different changes of state?

Disciplinary
knowledge:
Students
watch

Topic title and key concept:

Periodic table and bonding

Substantive Knowledge: What are trends in properties of groups on the Periodic table?

How do elements bond together?

What are properties of compounds?

Disciplinary
knowledge:
Students can
observe
reactions of
alkali metals
with oxygen and
water.

Cross-curricular knowledge:
Links to mathematics curriculum with the balancing of equations.

mathematics curriculum by using equations and calculating different quantities.

Topic title and key concept:

The Body this topic focuses on body systems as their processes such as circulatory and respiratory systems and the digestive system. It links with noncommunicable diseases such as CHD and risk factors for these.

Substantive **Knowledge:** What is the structure and function of body systems? How does the body break down and absorb nutrients? What are risk factors for noncommunicabl e diseases

Disciplinary knowledge: Students investigate how nutrients are tested for <u>Disciplinary</u> knowledge:

Students can

complete

practical activities looking at the growth of bacteria from different surfaces to show pathogen transfer or the effectiveness of disinfectants at removing bacteria from surfaces.

Cross-curricular knowledge: Links to the History curriculum and pathogens as causes for disease throughout history.

Topic title and key concept:

Atoms and radiation – this topic focusses on changes of state and the internal energy of substances including

including the intake of caffeine and distractions.

Crosscurricular knowledge: Links to the PE curriculum measuring reaction time displacement reactions and a required practical based on the electrolysis of aqueous solutions. Students also complete a required practical focussing on temperature changes in chemical reactions as well as optional examples of endothermic and exothermic reactions.

knowledge: Students have the opportunity to <u>create</u> models of the double helix structure of DNA. Students use various models to show the process of evolution and how a change environment and variation do not always lead to an

organism

evolving.

Disciplinary

Cross-curricular knowledge:
Links to
Geography and mining and quarries as geographical features.

Topic title and key concept:

Forces – the study of contact and noncontact forces and how these forces can be measured and calculated in various scenarios. Students also study the motion of objects and calculate the velocities and

in specific foods as well as the effect of pH and temperature on the rate of enzyme activity. Students also study the heart and can complete dissections themselves or access teacher demonstration of these.

Cross-curricular knowledge: Links to food technology and how nutrients are digested and absorbed in the body. Links to PE and the effect of exercise on the rate of respiration.

Topic title and key concept:

Chemical measurements students focus on measurements and calculations of quantities during chemical reactions including balancing equations, relative formula mass.

heating and cooling curves. Students also focus on the arrangement and motion of particles in solids. liquids, and gases and the limitations of this model. Students then move on to look at a more in depth model of the atom and how it is affected by the release of nuclear radiation. the half life of this radiation. and how objects can become irradiated or

Substantive Knowledge:

contaminated

What are changes of state and how is internal energy measured and changed?

What is nuclear radiation and what are its properties?

accelerations of objects.

Substantive Knowledge:

What are forces and how can they be calculated?

How can the motion of objects be described and quantified based on the forces acting on it?

Disciplinary

knowledge: There are a variety of practical activities in this topic including the measurement of weight and mass to determine the value of gravitational field strength on Earth. <u>Students</u> investigate acceleration and how the force applied to an object can increase its acceleration proportionally.

Cross-curricular knowledge: Links to the mathematics curriculum as

# **DO MORE: Milestone assessment end points**

Disciplinary knowledge in Science is often discussed as 'Working Scientifically' which has a range of skills related to practical work, modelling, analysis, and evaluation. The end points for this knowledge are split into different categories as shown below.

However, students must also be able to complete skills such as applying knowledge, evaluating data and hypotheses, explaining key concepts, and defining key terms. Below are end points for each of the year groups and topics based on these core skills.

Basic	Clear	Detailed

#### Safety and Risk

Recognise risks when prompted

#### **Apparatus**

Identify basic apparatus used in investigations

#### Method

Suggest ways to investigate a question

#### **Variables**

Name the three variables

#### **Graphs**

Label axes on a basic line or bar graph

#### **Conclusion and Evaluation**

Identify straightforward patterns in data

#### **Scientific method**

Give examples of how scientific methods and theories have changed over time

Recognise/draw/interpret diagrams

#### Safety and Risk

Act on suggestions to minimise risk

#### **Apparatus**

Choose correct equipment from a selected list with prompts

#### Method

Hypothesise a result based on an investigation

#### **Variables**

Name a control variable from a list of variables

#### **Graphs**

Clear

Label units on axes on basic line or bar graphs

# **Conclusion and Evaluation**

Make simple conclusions

#### Scientific method

Identify methods that can be used to tackle problems caused by human impacts on the environment Translate data to a representation with a model

#### Safety and Risk

Independently recognise risks

#### **Apparatus**

Independently choose the correct equipment

#### Method

Suggest ways to investigate a question

#### **Variables**

Identify variables that are difficult to control

# Graphs

Plot points on basic line or bar graphs

# **Conclusion and Evaluation**

Suggest ways to improve a method Identify anomalies

# Scientific method

Detailed

Describe specified examples of the technological applications of science Describe methods that can be used to tackle problems caused by human impacts on the environment

	and to establish a consensus about which claims should be regarded as valid Explain that reports of scientific developments in the popular media are not subjected to peer review and may be oversimplified, inaccurate, or biased

# **GO FURTHER: Skills Builder**

We are also explicitly embedding transferable 'Skills Builder' skills such as problem solving, aiming high and teamwork to prepare our students for higher education and employability skills for the future. This year in History we will focus on **TEAMWORK** including group decision making and recognising the value of others. **PROBLEM SOLVING** by exploring complex problems by analysing cause and effect, and understanding through research. Furthermore, we want our students to **AIM HIGH** by setting goals, prioritising tasks and involving others.

# **How does our Curriculum cater for students with SEND?**

Sandhill View is an inclusive academy where every child is valued and respected. We are committed to the inclusion, progress and independence of all our students, including those with SEN. We work to support our students to make progress in their learning, their emotional and social development and their independence. We actively work to support the learning and needs of all members of our community.

A child or young person has SEN if they have a learning difficulty or disability which calls for special educational provision to be made that is additional to or different from that made generally for other children or young people of the same age. (CoP 2015, p16)

Teachers are responsible for the progress of ALL students in their class and high-quality teaching is carefully planned; this is the first step in supporting students who may have SEND. All students are challenged to do their very best and all students at the Academy are expected to make at least good progress.

# Specific approaches which are used within Science include:

- Seating to allow inclusion
- Scaffolding to stretch and support in all lessons
- Resources are accessible yet challenging
- Displays and visual learning tools are used where necessary
- Where appropriate, support from additional adults is planned to scaffold students learning
- Group work and discussion
- Clear teacher/student communication
- Feedback that allows students to make progress, whether written or verbal
- Independent study/homework.
- Intervention when required

# How does our curriculum cater for disadvantaged students and those from minority groups?

As a school serving an area with high levels of deprivation, we work tirelessly to raise the attainment for all students and to close any gaps that exist due to social contexts. The deliberate allocation of funding and

resources has ensured that attainment gaps are closing in our drive to ensure that all pupils are equally successful when they leave the Academy. More specifically within the teaching of Science, we;

- work to identify barriers, interests and what might help each pupil make the next steps in learning.
- provide targeted support for under-performing pupils during lesson time, such as targeted questioning, live marking and seating
- ensure there are opportunities for students to make use of resources and gain homework support outside of lesson time through the use of Teams
- provide students with revision materials to reduce financial burden on families

# How do we make sure that our curriculum is implemented effectively?

- The Science curriculum leader is responsible for the design and implementation of the curriculum including quality assurance of lesson resources, schemes of learning, and assessments, as well as the monitoring and evaluation of this implementation to measure the impact.
- The subject leader's monitoring is validated by senior leaders.
- Staff have regular access to professional development/training to ensure that curriculum requirements are met and subject knowledge developed.
- Effective assessment informs staff about areas in which interventions are required. These
  interventions are delivered during curriculum time to enhance pupils' capacity to access the full
  curriculum.
- Curriculum resources are selected carefully and reviewed regularly.
- Assessments are designed thoughtfully to assess student progress, long term knowledge retrieval and also to shape future learning.
- Assessments are checked for reliability within departments and across the Trust.

There are several Science staff who mark for exam boards and provide vital CPD to the rest of the department to ensure reliability of data.

Gap analysis spreadsheets are used to identify areas of development for students at KS4 to identify areas of weakness. Enhanced results analysis is also used to identify departmental priorities for development to ensure students are making the highest progress.

#### How do we make sure our curriculum is having the desired impact?

- Examination results analysis and evaluation.
- Half-termly assessments based upon substantive and disciplinary knowledge covered during this time.
- Lesson observations.
- Learning walks for KS3 and KS4 based upon departmental priorities.
- · Work sample for each year group.
- Regular feedback from teaching staff during department meetings.
- Regular feedback from Middle Leaders during curriculum meetings.
- · Pupil Surveys.
- Parental feedback.
- Staff feedback through staff voice surveys.
